

# Spatial Disaggregation of Gross Domestic Product

An innovative method for producing high resolution economic activity information for Disaster Risk Management

*Paul Baptiste Blanchard, Brian Blankespoor, Johanan Rivera-Fuentes, Rashmin Gunasekera, Oscar Ishizawa, Luis Felipe Jiménez (working paper in preparation)*

# Summary

- 1) Context and motivations
- 2) Methodology
- 3) Visualizing disaggregated GDP
- 4) Strengths and limitations
- 5) Applications in Disaster Risk Management
- 6) Q&A

# Context and Motivations

Context  
●●

Methodology  
●●●●●●●●●●

Visualization  
●●●

Strengths and considerations  
●●●

Applications  
●●●

- **Spatial** component of disaster risk assessment
- Economic risk analysis → Gross Domestic Product (GDP)
- Spatial **mismatch** hazard-exposure
- Poor **statistical capacity** in developing countries + **informal** activities
- **Non-agricultural** component of GDP : different spatial structure.

→ *Objectives:*

- 1) Model a measure of economic activity at a **fine resolution**
- 2) **Scalability**

Context  
●●

Methodology  
●●●●●●●●●●

Visualization  
●●●

Strengths and considerations  
●●●

Applications  
●●●

- Why GDP?
    - “Monetary value of all goods and services produced in a country in a given period of time” (IMF)
    - Economic performance
    - GDP : refers to location ( $\neq$ GNI) = **spatial measure**
  - Accounting VS Spatial measure:
    - National accounts measure: Production, Income, Expenditure
    - Spatial: Production AND Consumption
      - workers, built-up areas, infrastructures... (non-agricultural)
-  **Scale** considered !

# Methodology

Context  
●●

Methodology  
●●●●●●●●●●

Visualization  
●●●

Strengths and considerations  
●●●

Applications  
●●●

- *Challenges:*

- Predict GDP at a **scale different** than GDP data observations
- Limited number of relevant indicators at cell level
- Measurement **errors** (including informality)
- **Comparability** of GDP values from country to country

Context

Methodology

Visualization

Strengths and considerations

Applications

Calibration

- Sub-national level

Predictions at  
sub-national  
levels

- Shares and levels
- Informality accounted for

Disaggregation  
at grid-cell  
level

- 1 km<sup>2</sup> resolution

Context  
●●

Methodology  
●●●●●●●●●●

Visualization  
●●●

Strengths and considerations  
●●●

Applications  
●●●

- *Use of **OECD GDP data***
  - more reliable data
  - lower informal shares
  - larger sample size
- Consistency
- *Calibration of a **distribution** model at the sub-national level*
  - ~~conversion issues~~
  - gets rid of some country fixed effects

Context  
●●

Methodology  
●●●●●●●●●●●●●●●●

Visualization  
●●●

Strengths and considerations  
●●●

Applications  
●●●

- *Assumptions:*
  - **External validity** assumption → correct specification, same underlying “true model”
  - Model “blind” to the nature of the production (formal VS informal)
- *Comparison OECD/LAC : expected results.*
  - comparable estimates
  - higher standard errors
  - lower goodness-of-fit

Context

Methodology

Visualization

Strengths and considerations

Applications

Context  
●●

Methodology  
●●●●●●●●●●

Visualization  
●●●

Strengths and considerations  
●●●

Applications  
●●●

- *Disaggregated GDP package:*

- non-agricultural GDP **grids** (0.83'  $\approx$  1 km<sup>2</sup>)
- **sub-national GDP** tables (regional, municipal)
- distribution (%) + different metrics (constant, current, LCU, \$...)
- Informality adjustments (Schneider et al.,2010)

# Strengths and Considerations

Context  
●●

Methodology  
●●●●●●●●●●

Visualization  
●●●

Strengths and considerations  
●●●

Applications  
●●●

- Distribution model → External validity assumption → **Reproducibility**
- External validity tested for on LAC data set
- Finer distinction **urban/rural** with urban categories
- **Nighttime lights** (≈electricity consumption) to control for productivity
- **Informal activities** included
- Accurate sub-national estimations

- GDP : refers to location ( $\neq$ GNI) → **spatial measure** ?
- “**Economic activity**” : byproduct consumption-production
- **Scale** at which it is used:
  - regional/municipal : accurate macroeconomic measure
  - cell-level : ?
- **Seasonality**

Context  
●●

Methodology  
●●●●●●●●●●

Visualization  
●●●

Strengths and considerations  
●●●●

Applications  
●●●

- What it does not do :
  - distinguish consumption/production at low scales
  - characterize economic activities
- Room for improvement :
  - more recent NTL data
  - GHSL human settlement data
  - level model using more inputs

# Applications in DRM

Context  
●●

Methodology  
●●●●●●●●●●

Visualization  
●●●

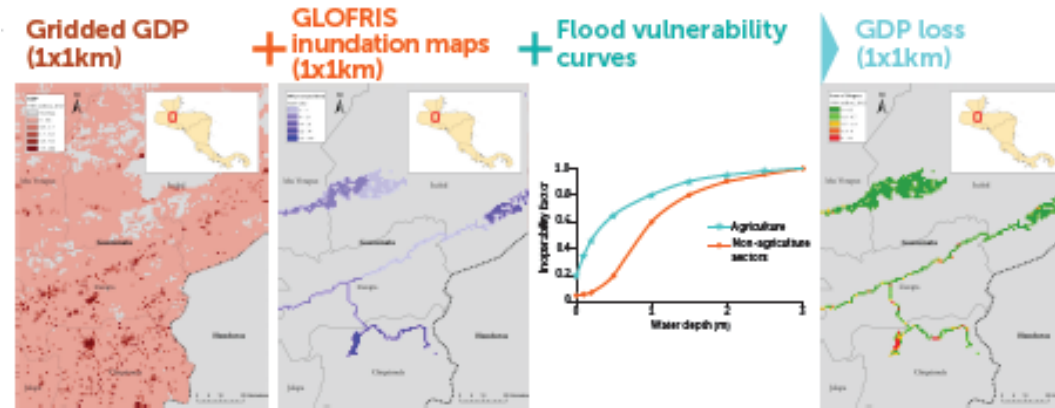

Strengths and considerations  
●●●

Applications  
●●●

- **Economic exposure** proxy
- Risk mitigation/quantification, preparedness...
- Economic vulnerability assessment
- Combined with other data to **characterize GDP** :
  - structure of the economy
  - interdependence of economic activities (non-structural losses)
  - economic vulnerability (firms sizes, business interruption...)

# Flood Risk Profiles in Central America

- Results presented are part of the *ongoing* Country Disaster Risk Profile (CDRP) study and The Disaster Risk & Resilience Analytics and Solutions (D-RAS) Knowledge Silo Breakers. Therefore, presented estimations and results should be considered as preliminary.
- The contents expressed in this presentation are entirely those of the authors. They do not necessarily represent the views of the International Bank for Reconstruction and Development/World Bank and its affiliated organizations, or those of the Executive Directors of the World Bank or the governments they represent.
