**Strengthening of historic buildings:
increasing resilience or loosing value?**

Prof. Dina D’Ayala
Department of Civil Environmental
and Geomatic Engineering,
University College London
d.dayala@ucl.ac.uk

- Definition and purpose of strengthening
 - Definition of value
 - Definition of Structural Resilience
 - Evidence from the field of damage to churches
 - Diagnostics
 - Current code strengthening provisions and structural response of strengthened buildings
 - Evidence from the field of latest trends
 - Can performance designed based strengthening be pursued?
 - Conclusions
- 

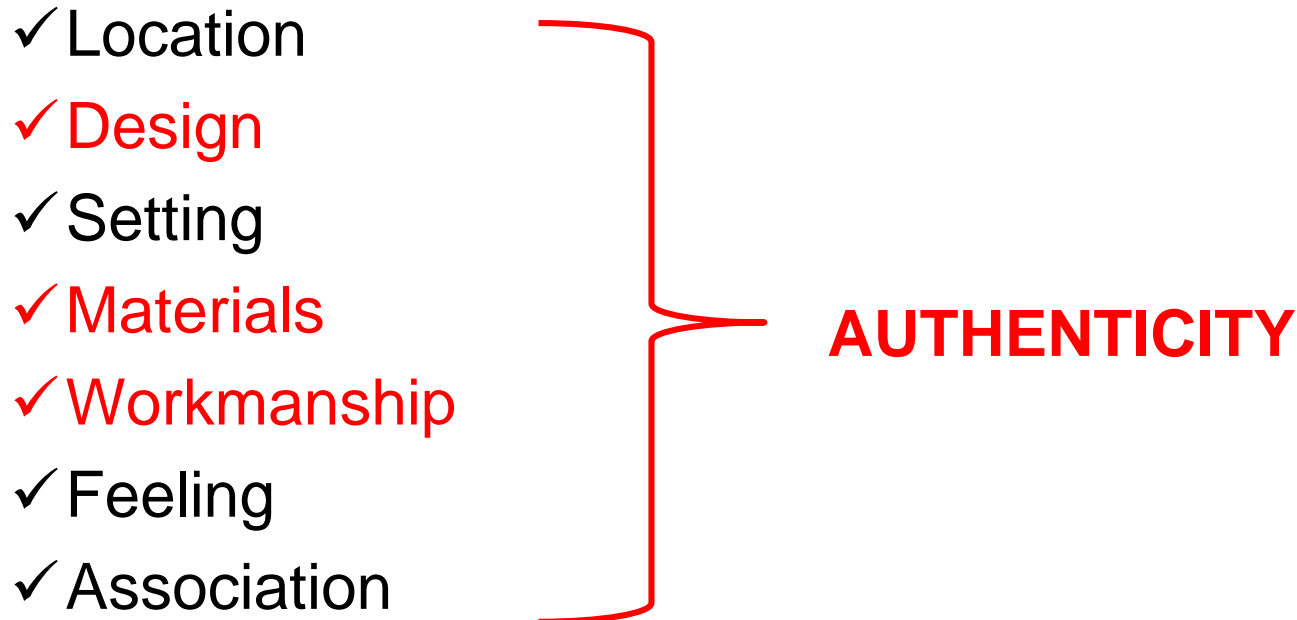

Definition of strengthening

- Strengthening is the action of reducing the vulnerability of a building to the expected seismic action before the occurrence of the probable earthquake¹
- Survey assessment and analysis are needed to identify weaknesses and determine priorities
- Local or global intervention might be appropriate.

1. IAEE Manual: Guidelines for Earthquake Resistant Non-Engineered Construction, 2004

- Cultural significance means aesthetic, historic, scientific, social or spiritual value for past, present or future generations. Cultural significance is embodied in the place itself, its **fabric**, setting, use, associations, meanings, records, related places and related objects. ²
- CULTURAL SIGNIFICANCE, HERITAGE SIGNIFICANCE AND CULTURAL HERITAGE VALUE ARE CONSIDERED AS SYNONIMOUS and are directly related to the AUTHENTICITY of the site which can be articulated in the following attributes:

2. Australia ICOMOS Burra Charter 1999.

➤ **Loss function**

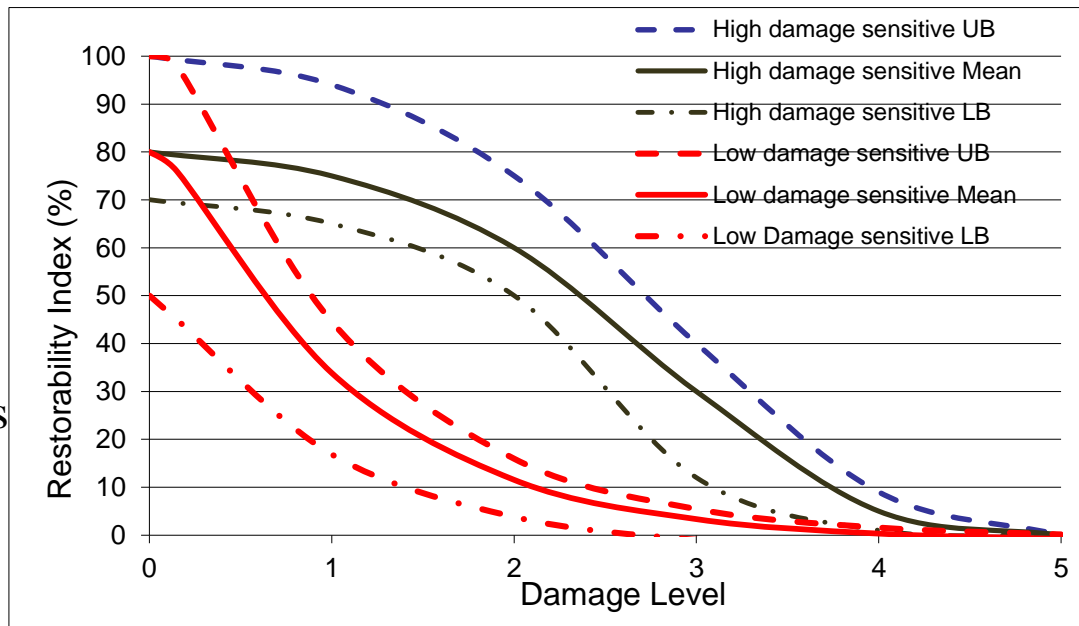

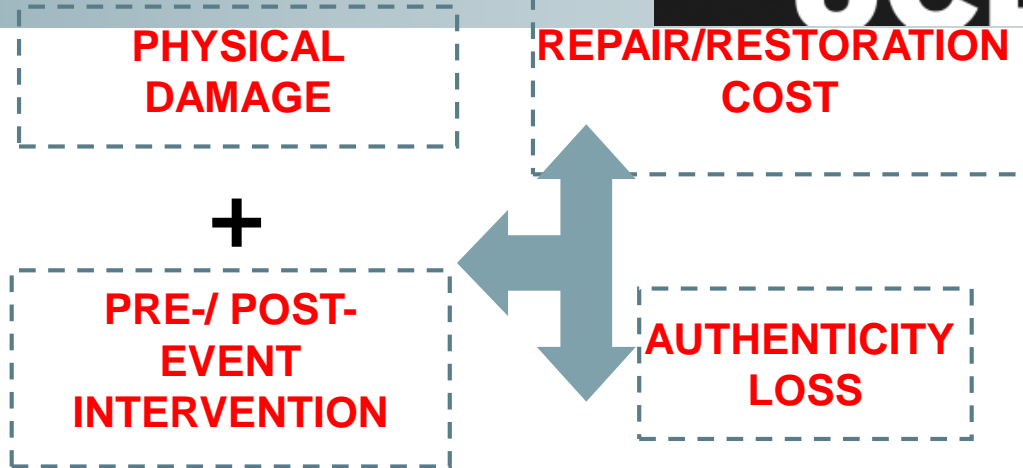

$$L_c = S_i * (1 - R_i)$$

➤ **where**

$$R_i = f(d_i, c, i, e)$$

➤ **Restorability depends on availability of:**

- Original building materials;
- Original documentation;
- Traditional craftsmanship or skills
- Sophisticated technologies;
- Financial support.

D Ayala, D. F., et al.(2006). A conceptual model for Multihazard assessment of the vulnerability of historic buildings. SAHC 2006, MacMillan India.

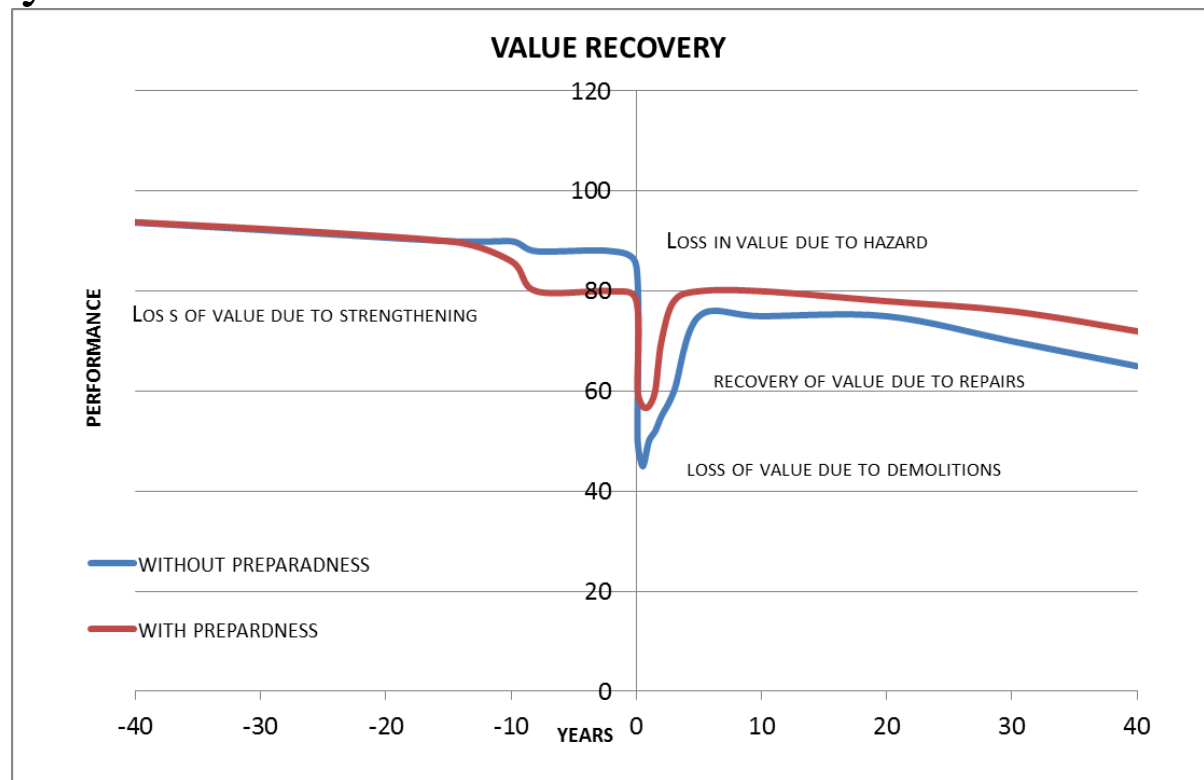

- **Resilience is the ability of a system to resist, adapt to, and recover from exposure to damaging events:**
- Recovery is defined by time and cost needed or prescribed to go back to pre-event functionality level
- **Robustness**
- **Redundancy**
- **Rapidity**
- **Resourcefulness**

Bruneau, M., et al., 2003. A Framework to Quantitatively Assess and Enhance the Seismic Resilience of Communities, *EERI Spectra Journal*, Vol. 19, No. 4, pp. 733-752

- **Resilience is the ability of a system to resist, adapt to, and recover from exposure to damaging events:**
- Recovery is defined by time and cost needed or prescribed to go back to pre-event functionality level
- **Robustness**
- **Rapidity**
- **Redundancy**
- **Resourcefulness**

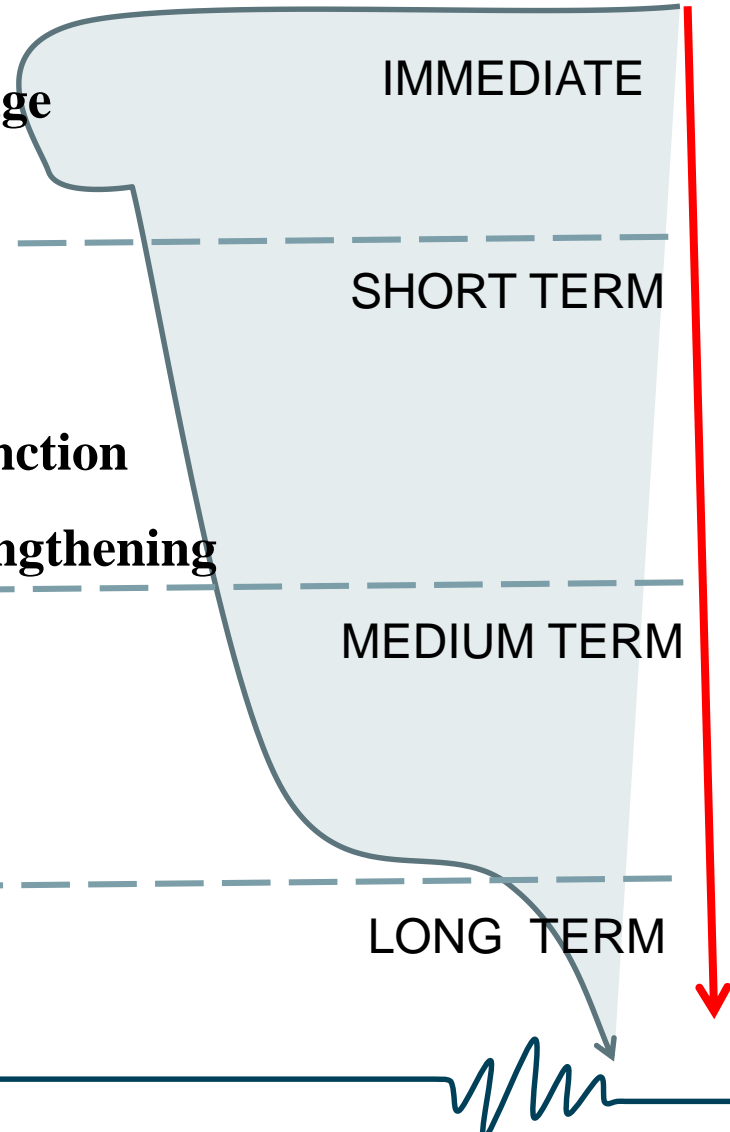

- **Tagging**
- **Debris clearance, documentation and storage**
- **Shoring / Demolition**

- **Documentation + Monitoring + Analysis = Understanding**
- **Review and definition of new/continued function**
- **Preliminary Design of restoration and strengthening**

- **Approval process + Funding**
- **Detailed design**
- **Site construction and modifications on site**

- **Monitoring**

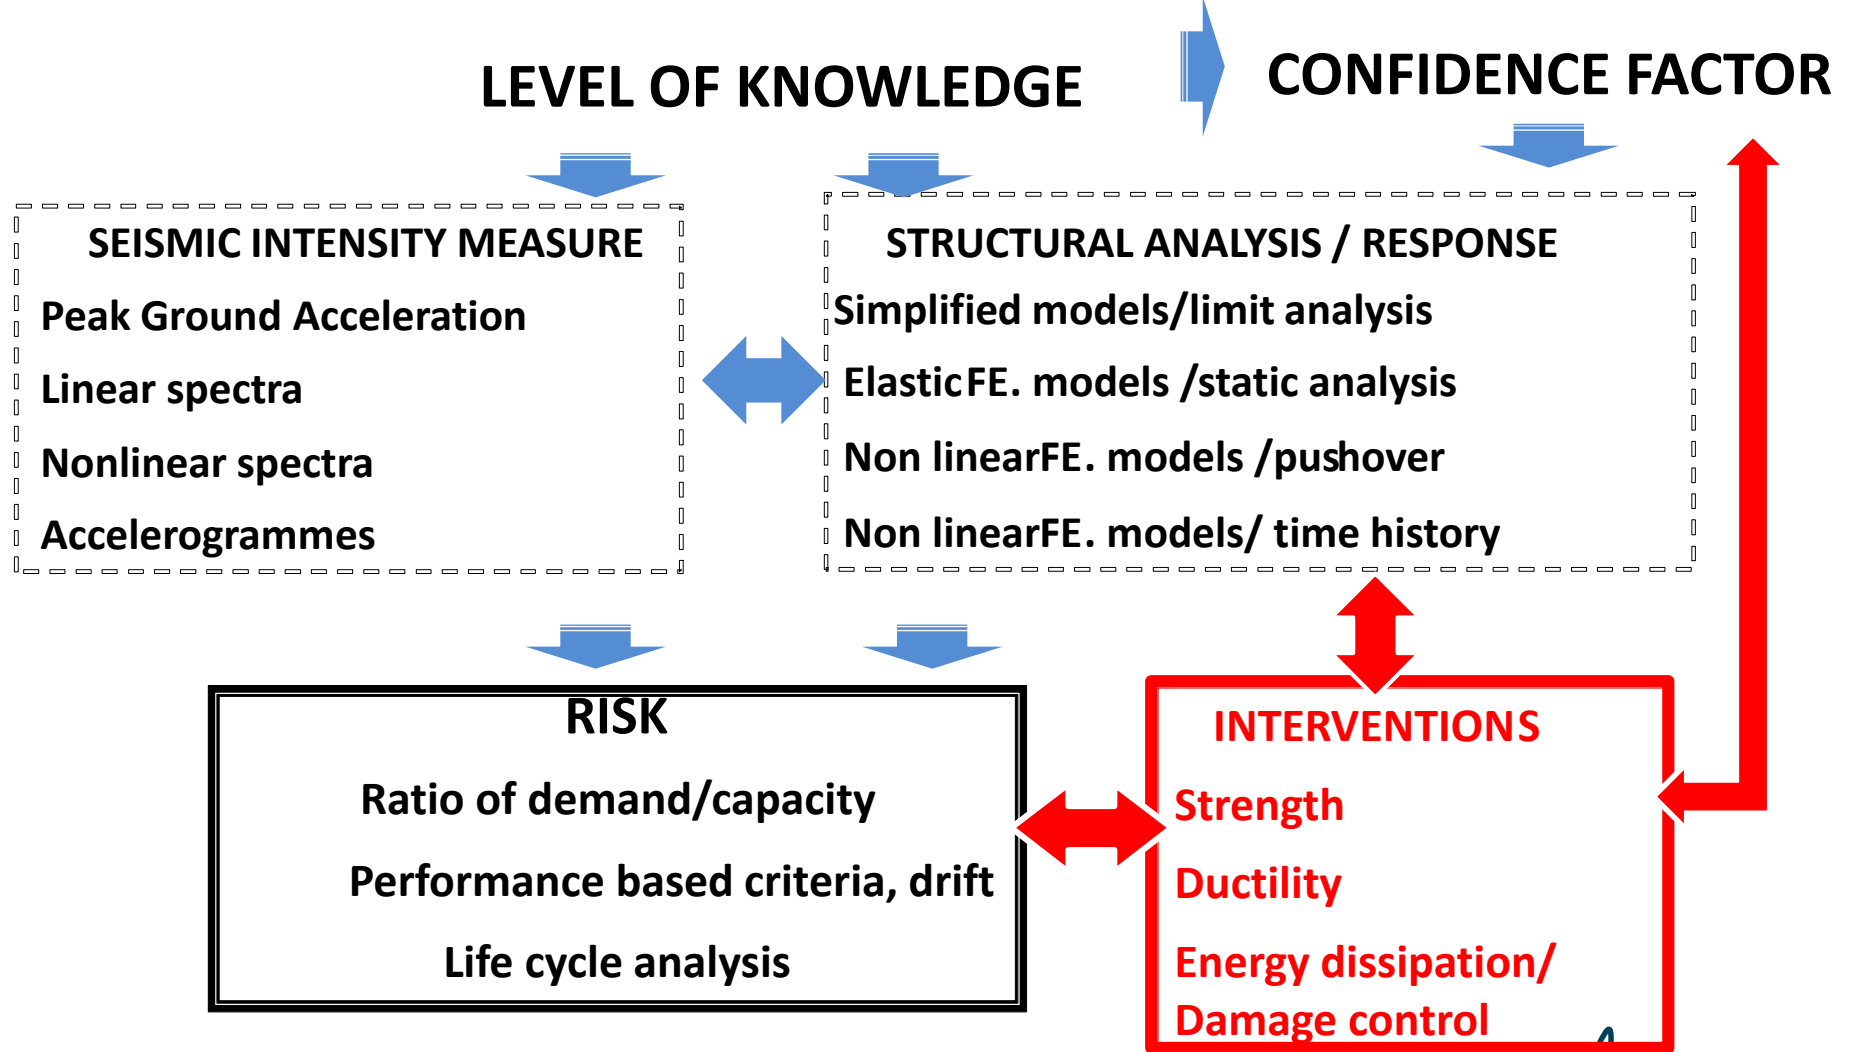

CONSERVATION PRINCIPLES

- **Preservation of Structural Authenticity and Integrity**
 - searches for significant data and information
 - identification of the causes of damage and decay
 - choice of remedial measures
 - implementation and **monitoring of effectiveness**
- **Enforcement of Structural Reliability**
 - Optimal Intervention: one that balances the safety requirements with the protection of character-defining elements, ensuring the least harm to heritage values”, (ISO/TC96/SC2, 2010)
 - Design should be a direct consequence of the safety judgement
 - Remedial measures should address root causes
- **Compatibility, durability, reversibility, monitorability of interventions**
 - Act as sacrificial elements
 - Extend the life of the building
 - Be retractable
 - Be possible to observe the +/- effect on original and amend

- *Annex on Heritage Structures of ISO/FDIS 13822, (ISO/TC96/SC2, 2010)*

KNOWLEDGE FRAMEWORK FROM SEISMIC CODES

➤ Double flat jack test

DAMAGE STATISTICS

| Earthquake | Magnitude MW | % of historic buildings severe damaged | Losses |
|--------------------------------------|--------------|--|----------------------------|
| Pisco, Peru', 2007 | 8.0 | 80% | 240 ML\$? |
| L'Aquila, Italy, 2009 | 6.3 | 54% | 16 BL€ ? |
| Maule,Chile, 2010 | 8.8 | 75% | 290 ML \$? |
| Christchurch, NewZealand, 2010 -2011 | 7.1 | 40% | 15BL\$? |
| Great East Japan Earthquake, 2011 | 9.0 | 744 | US\$235 billion, |
| Emilia, 2012 | 5.9 +5.8 | 27% | 1965M€ |
| Bohol, Philippines 2013 | 7.2 | 60% | 89.4 ML\$ |
| Nepal 2015 | 7.7 | 700 | 200ML\$ (heritage only) WB |

- **Concept of improvement**
- **Concept of upgrading**
- **NZ Guidelines indicate that for building that have capacity $<1/3$ of normal building they should be designed for 0.75 of design action**
- **Revision of Italian standards voted by Consiglio superiore Lavori Pubblici (14/11/2014)**
- **Improvement: for buildings in class 2 & 3 the capacity to demand ratio should be >0.10**
- **In the reconstruction in L'Aquila the capacity to demand ratio upper threshold was set = 0.6**

Masonry Fabric

Deterioration

Tie Beams

Floors

Roof

Aims to give direct testing/modelling strategy

For each macroelement we look in turn at each variable:

- Relevance (how influential is the variable?)
- Nature of the variable (positive or negative)
- Level of confidence (percentage) in this judgement

| MACROELEMENTS | VARIABLES | | | | |
|---------------|---------------|------------------|----------------|----------------|------------|
| | Resilience V1 | Deterioration V2 | Interaction V3 | Connections V4 | Masonry V5 |
| Base Course | B 70 | | | | |
| Arcades | | | | | |
| Tie Beams | | | | | |
| Floor | | | | | |
| Roof | | | | | |
| Adobe Walls | | | | | |

| MACROELEMENTS | VARIABLES | | | | | Level of confidence (%) |
|---------------|-------------------|---------------------|-------------------|-------------------|--------------|-------------------------|
| | Resilience V1 | Deterioration V2 | Interaction V3 | Connections V4 | Fabric V5 | |
| Base Course | B + 70 | D - 80 | A - 70 | | B +/- 80 | |
| Arcades | A + 70 | C - 60 | B - 40 | | A - 40 | |
| Tie Beams | B + 80 | D - 60 | A +/- 60 | C + 60 | | |
| Floor | A - 80 | C - 75 | B - 70 | | | |
| Roof | A - 80 | D - 75 | B - 75 | B +/- 40 | | |
| Adobe Walls | A - 80 | D - 80 | C - 80 | A - 70 | B + 80 | |

Interaction between floor beams and adobe wall

Distribution of influential classes and their nature for Casa Arones

Using data from;

- Numerical models;
- Analytical methods;
- Experimental tests;
- Non-destructive/Semi-destructive testing;
- On-site observations.

Global criteria

1. Regularity in elevation;
2. Regularity in plan;
3. In-plane and out-of-plane drift.

Resilience

Local criteria

1. Stability of the elements; Resilience
2. Maximum stresses and strains at interfaces; Interaction
3. Occurrence of cracking; Resilience
Interaction
4. Layout of masonry fabric; Quality of the fabric
5. Failure of Connections; Connections

Peru Seismic Code E.030

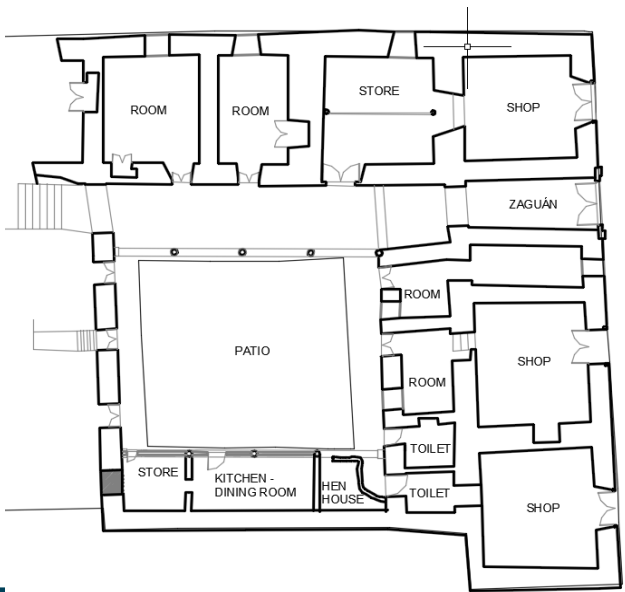

FEMA 365 ASCE 41-06

4.2.3.2 Criteria for regularity in plan

- (1) P For a building to be categorised as being regular in plan, it must satisfy the conditions listed in the following paragraphs.
- (2) With respect to the lateral stiffness and mass distribution, the building structure shall be approximately symmetrical in plan with respect to two orthogonal axes.
- (3) The plan configuration shall be compact, i.e., each floor shall be delimited by a polygonal convex line. If in plan set-backs (re-entrant corners or edge recesses) exist, regularity in plan may still be considered if the set-backs do not affect the floor in-plan stiffness. The application of this paragraph shall not exceed 5% of the floor area.
- (4) The in-plan stiffness of the floor shall have a small effect on the lateral stiffness of the vertical structural elements. In this respect, the application of this paragraph shall be comparable to that of the central part of the building.

EN 1998-1, 2004

| TABLA N° 4 STRUCTURAL IRREGULARITIES IN HEIGHT | |
|---|---|
| Stiffness Irregularities – Soft Floor | In each direction the sum of the transversal sections of the vertical elements resistant to shear in any story, columns and walls, is lower than 85% of the corresponding sum for the superior story, or is less than 90% of the average sum for the three consecutive stories. It is not applicable to basements. For buildings which have different story heights multiply the values mentioned above by (h_i/h_o) , where h_o is the different story height and h_i is the typical story height. |
| Mass Irregularity | It is considered that mass irregularity exists when a story mass is higher than 150% of the mass of the adjacent floor. It is not applicable to basements. |
| Vertical Geometric Irregularity | The dimension in plan of the structure resistant to lateral loads is higher than 130% of the corresponding dimension in an adjacent floor. It is not applicable to basements or rooftops. |
| Discontinuity in Resistant Systems. | Out of line in vertical elements, due to orientation change or by a displacement with a higher magnitude than the element dimension. |

NZEE URM Code, 2006

Table 3.4: Guide to severity of critical structural weaknesses

| Critical structural weakness | Effect on structural performance | | |
|--|--|--|--|
| | Severe | Significant | Insignificant |
| Plan irregularity | | | |
| L-shape, T-shape, E-shape | Two or more wings length/width > 3.0, or one wing length/width > 4 | One wing length/width > 3.0 | All wings length/width ≤ 3.0 |
| Long narrow building where spacing of lateral load resisting elements is ... | > 4 times bldg. Width | > 2 times bldg. Width | ≤ 4.0 times bldg width |
| Torsion (Corner Building) | Mass/centre of rigidity offset > 0.5 width | Mass/centre of rigidity offset > 0.3 width | Mass/centre of rigidity offset < 0.2 width or effective torsional resistance available from elements orientated perpendicularly. |
| Ramps, stairs, walls, stiff partitions | Clearly grouped, clearly an influence | Apparent collective influence | No or slight influence |
| Vertical irregularity | | | |
| Soft storey | Lateral stiffness varies > 150% | Lateral stiffness varies 100-150% | Lateral stiffness varies < 100% |

Global Criteria: in-plane and out-of-plane drift

| Source | In-plane drift (%) | | | Out-of-plane drift (%) | | |
|---|----------------------|--------------------|---------------|------------------------|---------------------------|-------------------------------------|
| | Damage Limitation | Significant Damage | Near Collapse | Damage Limitation | Significant Damage | Near Collapse |

Results of Detailed Diagnosis of Casa Arones

ITALIAN GUIDELINES: OPCM 2008-2011

- **Out-of plane failure prevention.** Ties and anchors in two orthogonal directions to connect orthogonal walls, floors to walls, vaults to walls. Ring beams: conventionally in reinforced concrete, but reinforced masonry or steel preferred. External wrapping and confinement using FRP can be seen as an alternative. Anchorage is a problem.
- **In-plane strengthening and stiffening.** Grouting to improve integrity and coherence of walls. Reinforced core grouting only in extreme cases of very poor coherence of the wall's leaves. Shotcreting should also be avoided
- **Improving diaphragm action.** In timber floor and roofs by means of double layers of planks or thin mortarcrete topping and connection of joists to walls by anchors. Vaults should be strengthened by including spandrel walls. Extradossal use of FRP strips is acknowledge but not recommended

- **In-plane strengthening** – i.e. concrete shear walls and facings, concrete frames, braced steel frames, infilling openings, plywood faced shear walls.
- **Face-load strengthening** – i.e. Floor, roof and ceiling ties, rosehead washers, mullion supports, parapet bracing cantilever columns, composite fibre flexural strips, butt or propping, helical steel through ties, concrete overlay
- **Combined face-load and in-plane strengthening** – i.e. Vertical and/or horizontal post tensioning, deep drilling reinforcing of walls, grouting rubble filled walls, concrete overlay walls.
- **Diaphragm strengthening** – i.e. plywood overlay diaphragm boundary connections, chords, drag ties, steel flat overlay concrete topping overlays, roof and ceiling diaphragms.
- **Chimney, towers and appendages** – i.e. securing chimneys and towers to diaphragms and/or walls, wire tying

PERFORMANCE DESIGN

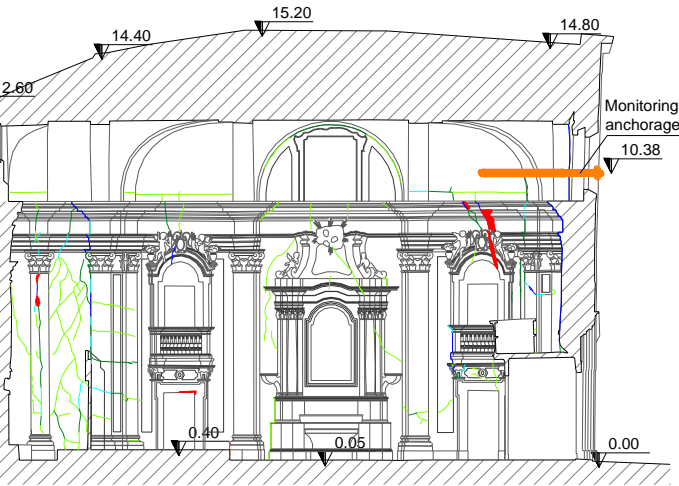

PERFORMANCE MONITORING

The oratory of S. Giuseppe dei Minimi in L'Aquila Italy

RESPONSE OF INSTRUMENTED ANCHOR

- The earthquake engineering community has shown increased sensitivity towards the importance of preservation promoting research in new assessment and strengthening methods
- Public cultural differences exist and cannot be ignored when devising policies.
- Recent initiatives such as the ICOMOS New Zealand Charter 2010 (ICOMOS 2010) show a change in perspective and perhaps a different acceptance of risk.
- Much training and education of professional engineers is needed to ensure that the shift in design emphasis from force to energy and displacement requirements is fully understood. Similar training is also needed for contractors
- In the field still far too often upgrading is pursued in terms of increasing strength and stiffness and some assessment criteria are far too conservative.
- The economics of developing and installing dissipative devices, can be overcome, as shown by the prototype devices which can be manufactured in small sizes and at costs which is affordable in the retrofit of heritage buildings, as well as more prestigious landmark.
