Background

- Lower educational level for girls is common in developing world.
- A lost opportunity for education is not only harmful for girls, but also has wide-reaching implications (ICRW, 2006).
- Considering education as the best contraceptive to development, many governments now support women's education not only to accelerate economic growth but also for other social advancement, including prevention of child marriage.
- As we know child marriage constitutes a violation of the rights of the girls who are forced to be married as children. It deeply affects their life through considerably lower educational conditions, health complications, higher risk of violence at home, and social exclusion (Nguyen & Wodon, 2014).

Child marriage-related policies and reproductive health in Bangladesh: a cross-sectional analysis

Mohammad M Islam, Anita J Gagnon

Abstract

Background Marriage below the age of 18 years is practiced in low-income countries despite policies to diminish this practice. We assessed these policies and age at marriage, sociodemographic characteristics and child marriage, and child marriage and grand multiparity (gave birth five or more times) and pregnancy termination.

Methods We did this cross-sectional analysis of data from the 2011 Bangladesh Demographic and Health Survey, which contains data for 17 842 ever-married women. We plotted age at marriage (1993–2011) against time corresponding to policies to diminish child marriage and tested for trends. We also did cross tabulations to compare sociodemographic characteristics of women married as children with those married as adults, and logistic regression to assess child marriage and grand multiparity, and pregnancy termination.

Findings 13 859 women (77.7%) were married before the age of 18 years and 8327 (65.4%) women married as children gave birth before age 18 years. 507 (77.3%) of 45–49-year-old respondents in 1993–94 were married by age 15 years, compared with 741 (17.2%) of 15–19-year-olds in 2011. Factors associated with child marriage included being Muslim, being in the poorest wealth index, being uneducated and unemployed, living in a rural area, having more children, and preferring more children or undecided fertility. Child brides were more likely than were adults to be grand multiparous and have had a pregnancy terminated.

Interpretation Child marriage in Bangladesh has decreased but remains high. The use of law as a means of regulating early marriage is not sufficient, although policies such as the adoption of the International Conference on Population and Development programme of action (1994) and the Birth and Death Registration Act (2004) seem to have had some effect. Additional strategies to address child marriage include furthering law reform, communicating through religious leaders, improving women's economic status, promoting female education, providing more employment opportunities to women, and ensuring access to information in rural areas.

Funding Global Health Research Capacity Strengthening Program.

- 
- *Although the legal age of marriage remains 18 years for girls last year the government of Bangladesh has taken an initiative to make age 16 as the legal age of marriage with permission either from their parents or from the court.*
 - The vulnerable situation of millions of young females may be under the threat of further deterioration if women get married before age 16.
 - This will raise questions to achieve socioeconomic enhancement and empowerment of the women who marry by <16 as well as <18 years as children.
 - Moreover, studies on the impact of different married age groups on educational attainment, particularly <16 and <18 years of women are not adequately available.

Research questions

- To what extent the effect of child marriage on educational attainment vary by women married as children aged below 16 and 18 years?, and
- How does age at first marriage of a woman affect her length of participation in school?

Objectives

- To examine the effects of child marriage on secondary incompleteness and higher educational attainment of women married before 16 and 18 years of age ; and
- To examine to effect of child marriage on total years of schooling of women who were married before age 16 and 18 years.

Data & methods

- **Data:** *2011 Bangladesh Demographic and Health Survey* of which 17,749 respondents were 15-49 years old ever-married women.
- **Methods:** Bivariate and multivariate analyses were conducted

Figure 1: Patterns of Women's Educational Attainment by Age at First Marriage (%)

RESULT 1

- Child marriage (whether married before 16 or 18 years) leads to higher rate of secondary in complete education for women compared to their respective reference category even after adjusting for their age, employment status, economic condition, religion and division.

Result 3

- Reducing each year of age at first marriage for women would lead to six months reduction in their years of schooling suggesting that two years decline in age at marriage (e.g., from 18 to 16) would cause one year loss of schooling on average.

Table 4. OLS regression estimates of the effect of age at first marriage on years of schooling

Conclusions & policy implications

- Child marriage before age 16 (instead of 18) leads to higher rate of secondary incomplete education, and lower rate of higher educational attainment for women.
- Completing higher secondary education will bring higher employment opportunities compared to those who could not finish higher secondary education.
- If Bangladesh wants to harvest the benefits of education effective strategies should be taken to prevent child marriage instead of making 16 years as the legal age of marriage for female. Therefore, the government should take this rationally while reviewing legal age of marriage for young females in a way that is conducive for their socioeconomic advancement in general, more particularly for educational development.

Limitations

- Due to non-availability of data it was not possible to include parents' education into analysis to predict the differential impact of child marriage (whether before 16 or 18) on educational attainment of women.
